

I created a simple sales dashboard containing two joined sheets using the 'Superstore' data set. Global sales can be viewed by category and by month.

The 'region' filter is linked to both sheets. Updating the regions updates both graphs. Selecting, a datapoint on one of the graphs highlights information in one of the other graphs.

The next dashboard shows quantities sold and profits per market. Clicking on a market, gives detailed information and alters the corresponding bubble or column in the other graph.
